PROJECT SYNOPSIS

Mini Project — Team-Based Application

---

1. Project Title

EventHive: A Collaborative Campus Event Planning and Volunteer Coordination Platform

2. Introduction / Project Overview

EventHive is a team-based web application that helps student clubs and groups plan and manage campus events in one place. Teams can create events, assign tasks, manage volunteers, and track progress, replacing scattered tools like WhatsApp, Excel, and Google Forms.

3. Problem Statement

Campus event organization is often chaotic because teams use multiple disconnected tools. Task ownership is unclear, volunteer details get lost, and coordinators lack a clear view of progress, leading to confusion and poor coordination.

4. Objectives of the Project

- Develop a collaborative platform for planning and managing campus events
- Enable task assignment, volunteer management, and progress tracking
- Conduct UX research and create UI prototypes
- Implement GitHub collaboration, CI workflow, and Docker containerization
- Deliver a functional MVP

5. Proposed Methodology / Approach

Conduct short UX research with students involved in events and create personas. Design high-fidelity prototypes in Figma and perform basic usability testing. Develop the application using GitHub branches and pull requests. Containerize the app with Docker and set up a GitHub Actions CI pipeline. Test core flows and refine based on feedback.

6. Technologies and Tools Used

React, Tailwind CSS, Node.js + Express (or FastAPI), PostgreSQL/MongoDB, JWT, Docker, GitHub Actions, GitHub, and Figma.

7. Expected Outcome

A working MVP with event creation, task board, volunteer management, shared dashboard, clean UI, Docker setup, and a GitHub repository with CI pipeline and UX research notes.

Student Details

Batch Number	6
Lab Batch	G1

Student Names	Sujay Chandra K Sujan S Shreyas R Siddhappa Tangadi Srujan T S
